Lahar

Lahar is an Indonesian word for “mudflow” that originated from a volcano.

It is a mass of rock, mud and water that travels rapidly downstream due to gravity.

It can flow many miles downstream from the volcano making this a threat to residences living near a volcano.

Because of the threat that a lahar may cause, scientists are ready to deploy a lahar-detection system whenever there is an eruption.

Residences are strictly advised to leave immediately if they were warned in order to protect themselves.
